

Compression and Expansion...

CAM12: Dynamics

The 64-bit Dynamics Processor contains three modules: a compressor, an upward expander and a downward expander. Each of these modules offers eight audio channels, can be fully automated, and you can use any combination of the processes simultaneously.

Envelopes

Designed to the very highest audio standards, all three modules offer precise envelopes with positive and negative 'read-ahead', so you can make the processing very transparent, or add punch to the sound.

Side-chain EQ

Each process offers CEDAR's powerful IIR Precision side-chain EQ which - for even greater flexibility - allows you to fine-tune the Gain Profile to respond to user-defined frequency ranges in the input signal.

Linking

Each process offers powerful linking facilities that you can use to create ducking, or to preserve the soundfield when processing multi-channel material.

Parallel processing

All three modules offer flexible parallel processing for increased flexibility in mastering applications.

So much more than just audio restoration
